CPE 314 — Software Design & Software Design Laboratory

Week 11 — Final Defense Grading Checklist

40% of the Finals Term Grade | Scored out of 100

This checklist is the detailed, point-scored version of the Final Defense Rubric: it verifies that every mandatory technical requirement is fully implemented and that each member can individually explain the code attributed to them in git history. The Individual Q&A line is scored per member and can reduce an individual's grade below the group's shared score if that member cannot explain their own committed code — this is the mechanism that keeps grading fair when contribution is uneven. This checkpoint is worth 40% of the Finals Term Grade (replacing the written finals exam).

Grading Checklist

#	Criterion	Description / What's Being Checked	Max Points	Points Awarded
1	Functionality — Runs End-to-End & Handles Edge Cases	App runs end-to-end without crashing during the live demo, on the actual presentation machine, start to finish, and handles at least one invalid/edge-case input gracefully, demonstrated live without crashing.	9	
2	Functionality — All 9 Requirements Demonstrable	All 9 mandatory technical requirements are demonstrable in the running app — cross-checked against actual source files.	6	
3	OOD — Hierarchy Design & Meaningful Polymorphism	Class hierarchy is sensible and respects Single Responsibility, reviewed directly in the IDE, and abstraction/polymorphism is exercised meaningfully at runtime — not just declared or superficial.	8	
4	Data Layer — Schema Accuracy & Parameterized SQL	ER model is correct and matches the live database schema, verified by opening the actual .db file if needed, and JDBC CRUD uses parameterized SQL (PreparedStatement) throughout — spot-checked in source, no string-concatenated SQL.	8	
5	Concurrency — Background Threading & Stability	Long-running operations run on a background thread, confirmed live (inspecting source if needed), and the UI never freezes with no visible race conditions in shared state, confirmed by interacting with the UI during a long operation.	6	
6	Data Mining &	Real aggregation/frequency	5	

	Visualization — Real Analysis & Labeled Chart	analysis runs over actual app data, confirmed by changing an input and re-running if needed, and the resulting chart has a title, labeled axes, and a legend if applicable, correctly reflecting the real analysis.		
7	Automated Tests — Passing Suite & Edge-Case Coverage	6+ JUnit tests exist and pass, run live on the presentation machine, and tests cover a meaningful edge case per tested class, confirmed by opening at least one and checking it asserts something real.	4	
8	Code Quality & Git History	Code is readable, with consistent naming and reasonable structure, confirmed by skimming the codebase, and commit history is meaningful and shows balanced contribution across members, confirmed via the commit graph.	4	
9	Design Document Progress	This week's required section(s) of the team's Project Design Document are complete — see Week11_DesignDoc_Checklist.docx for the detailed breakdown	25	
10	Member Contribution (Peer-Graded)	Score derived from this member's peer-evaluation ratings from teammates (see the Peer Evaluation table below).	15	
	TOTAL		90	

This table sums to 90, not 100 — the remaining 10 points are the Individual Q&A score, scored per member in the standalone table below rather than once for the whole group.

Individual Q&A Scoring

Worth 10 of this week's 100 points. During the Individual Q&A segment of the Final Defense, the instructor asks each member questions about code they personally committed, verified against that member's git history (see Section 'Individual Q&A' in the Final Defense Guidelines). Write each teammate's name into a blank column header below, then record their Q&A score out of 10.

Criterion						
Q&A Score (out of 10)						

A group may earn a strong group score on Functionality through Code Quality, but an individual member who cannot explain their own committed code has their personal grade reduced independently of the group score via this Individual Q&A score.

Peer Evaluation — Member Contribution Scoring

Each member privately rates every teammate (not themselves) on the five criteria below, 1-5 (1 = did not contribute/unreliable, 5 = excellent). A member's 15-point Member Contribution score is the average rating received from teammates, scaled to 15: (average ÷ 5) × 15.

There are 6 identical peer-rating tables below, one per group position, in order (the 1st table is for Member 1, the 2nd for Member 2, and so on). Fill out only the ONE table matching your position in the group — for a 5-member group, one table goes unused. Write your name on the "Your Name (Rater)" line above your table, write each teammate's name into a blank column header, then rate every teammate 1-5 on each criterion below their name; do not rate yourself.

Your Name (Rater): _____

Criterion					
Preparedness & Effort					
Quality of Work					
Collaboration & Reliability					
Communication					
Meeting Deadlines / Follow-Through					

Your Name (Rater): _____

Criterion					
Preparedness & Effort					
Quality of Work					
Collaboration & Reliability

Meeting Deadlines / Follow-Through					

Your Name (Rater): _____

Criterion					
Preparedness & Effort					
Quality of Work					
Collaboration & Reliability					
Communication					
Meeting Deadlines /					

Follow-Through					

Your Name (Rater): _____

Criterion					
Preparedness & Effort					
Quality of Work					
Collaboration & Reliability					
Communication					
Meeting Deadlines / Follow-Through					

Your Name (Rater): _____

Criterion					
Preparedness & Effort					
Quality of Work					
Collaboration & Reliability					
Communication					
Meeting Deadlines / Follow-Through					

Your Name (Rater): _____

Criterion					
Preparedness & Effort					
Quality of Work					
Collaboration & Reliability					
Communication					
Meeting Deadlines / Follow-Through					

Fairness note: the instructor reviews all peer ratings before finalizing scores. Unusual patterns (e.g., everyone rating everyone a perfect 5, or one member rated far below the rest with no explanation) trigger a follow-up conversation with the group — the same discretion used for the Individual Q&A line item above, which lets an individual's score be adjusted independently of the group score.

Final Score Summary per Member

Most checklist criteria above (including Design Document Progress) are scored once for the whole group. Member Contribution (15 points, peer-graded) and Individual Q&A (10 points, from the separate Individual Q&A Scoring table above) are the two exceptions — both differ per student. Use the table below to record each member's final score.

Member Name	Group/Shared Score (out of 75)	Individual Q&A (out of 10)	Member Contribution — Peer Score (out of 15)	Total (out of 100)
Member 1				
Member 2				
Member 3				
Member 4				
Member 5				
Member 6				

Note: unlike the other three checklists, this document's Individual Q&A score (10 points) is scored per member from the standalone Individual Q&A Scoring table above, not once for the whole group — copy each member's Q&A score into their row here.

How to Submit (Git)

No new branch this week. The Final Defense grades whatever is on main in your team's cpe314-<edp>-capstone-team-NN repo once Milestone 2 is merged — your instructor tags that state of main at defense time.

Before your defense slot: make sure Milestone 2 is merged into main, and every member has reviewed their own commit history — this is a direct requirement in Final_Defense_Guidelines_Rubric.docx, not optional prep.

```
git log --author="you"
```

See 00_GitHub_Workflow/Student_Guide_Group_Project.md for the full pre-defense checklist.
