CPE 314 — Software Design & Software Design Laboratory

Week 9 — Milestone 1 Check-in

Core Structure & Data Layer | 15% of the Finals Term Grade

Goal of This Milestone

By the end of Week 9, the skeleton of your application should run: your class hierarchy compiles and is used somewhere real, your database schema exists and is reachable from Java, and your GUI opens with at least one working control. Data mining, full API integration, and polish come in Milestone 2 — do not try to finish everything now.

Grading

This checkpoint is graded using a detailed 100-point checklist — see Week09_Checklist.docx for the full Student Self-Check and Instructor Grading tables (15% of the Finals Term Grade). Bring working code, not slides — every item on that checklist should be demonstrable live, not just described.

In-Class Demo Format (5 minutes per group)

1. Show your class hierarchy in the IDE and explain the responsibility of each class (1 min)
2. Run the app; demonstrate the working GUI control (1 min)
3. Show the database file/table structure and run one live query (1.5 min)
4. Run your JUnit tests live and show them passing (1 min)
5. Answer 1 quick instructor question directed at a specific member (0.5 min)

If You're Behind

Partial credit is available for partial progress — a group with a working data layer but no GUI yet still demonstrates real progress. Silence or no repository activity is what loses points here, not an honest "we're behind on X, here's our plan to catch up."
