CPE 314 — Software Design & Software Design Laboratory

Week 9 — Milestone 1 Grading Checklist

15% of the Finals Term Grade | Scored out of 100

This checklist verifies that the skeleton of the application is real and running by the end of Week 9: the class hierarchy compiles and is used polymorphically, the database schema is reachable from Java, the GUI opens with at least one working control, and testing/version-control habits are underway. It gates the subset of the 9 mandatory technical requirements that should already be demonstrable at this stage — Object-Oriented Design, Data Structure / Recursion, Automated Testing, and the Data Layer — full API integration, concurrency, mining, and visualization are not expected until Milestone 2.

Grading Checklist

#	Criterion	Description / What's Being Checked	Max Points	Points Awarded
1	OOD Hierarchy & Polymorphism in Use	Abstract class or interface defined with at least 2 concrete subclasses/implementations — confirmed by inspecting the class hierarchy in the IDE — and the hierarchy is genuinely used polymorphically at runtime (invoked via a shared reference type) somewhere in the running app, not just declared.	9	
2	Data Structure Usage & Recursive Method	At least one Stack, Queue, or Map is used purposefully in the code, and at least one genuinely recursive method exists with a real base case that cannot be trivially rewritten as a one-line loop — the group can point to both in source and explain them.	9	
3	Database Schema	SQLite database file exists with an ER-derived schema of 3+ tables, matching the group's ER sketch from their proposal (verified by inspecting the file directly).	5	
4	JDBC CRUD — Parameterized INSERT & SELECT	At least one working JDBC INSERT and one working JDBC SELECT execute successfully against real data, demonstrated live (not a pre-recorded screenshot) — and all JDBC SQL uses PreparedStatement with bound parameters, no string-concatenated SQL, confirmed by reading the source.	13	
5	GUI Launches &	GUI window opens without	7	

	Control Wired	crashing, verified by launching the app directly, and at least one interactive GUI control is wired to a working event handler, verified by clicking it and confirming the handler fires correctly.		
6	JUnit Tests — Existence & Edge-Case Coverage	At least 2 JUnit 5 tests exist and pass, run live from the IDE/command line with 0 errors, and at least one test covers a non-trivial/edge case, not just the happy path — confirmed by opening and reading the test.	6	
7	Git Commits — Presence & Balanced Contribution	Git repository shows commits from every group member, verified via the commit graph/history, and contribution is reasonably distributed across members — reviewed by commit counts/lines changed, flagging anyone with near-zero contribution.	6	
8	Member Understanding & Realistic Self-Assessment	Each member can explain a specific line of their own committed code when asked — including members other than the presenter — and the group can articulate, specifically and realistically, what remains to be done before Milestone 2.	5	
9	Design Document Progress	This week's required section(s) of the team's Project Design Document are complete — see Week09_DesignDoc_Checklist.docx for the detailed breakdown	25	
10	Member Contribution (Peer-Graded)	Score derived from this member's peer-evaluation ratings from teammates (see the Peer Evaluation table below).	15	
	TOTAL		100	

Peer Evaluation — Member Contribution Scoring

Each member privately rates every teammate (not themselves) on the five criteria below, 1-5 (1 = did not contribute/unreliable, 5 = excellent). A member's 15-point Member Contribution score is the average rating received from teammates, scaled to 15: (average ÷ 5) × 15.

There are 6 identical peer-rating tables below, one per group position, in order (the 1st table is for Member 1, the 2nd for Member 2, and so on). Fill out only the ONE table matching your position in the group — for a 5-member group, one table goes unused. Write your name on the "Your Name (Rater)" line above your table, write each teammate's name into a blank column header, then rate every teammate 1-5 on each criterion below their name; do not rate yourself.

Your Name (Rater): _____

Criterion					
Preparedness & Effort					
Quality of Work					
Collaboration & Reliability					
Communication					
Meeting Deadlines / Follow-Through					

Your Name (Rater): _____

Criterion					
Preparedness & Effort					
Quality of Work					
Collaboration & Reliability					
Communication					
Meeting Deadlines / Follow-Through					

Your Name (Rater): _____

Criterion

Collaboration & Reliability					
Communication					
Meeting Deadlines / Follow-Through					

Your Name (Rater): _____

Criterion					
Preparedness & Effort					
Quality of Work					
Collaboration & Reliability					
Communication					
Meeting Deadlines / Follow-Through					

Fairness note: the instructor reviews all peer ratings before finalizing scores. Unusual patterns (e.g., everyone rating everyone a perfect 5, or one member rated far below the rest with no explanation) trigger a follow-up conversation with the group — the same discretion used for the Individual Q&A adjustment at the Final Defense.

Final Score Summary per Member

Most checklist criteria above (including Design Document Progress) are scored once for the whole group. Member Contribution (15 points, peer-graded) is the exception — it differs per student, based on the peer ratings each member receives. Use the table below to record each member's final score.

Member Name	Group/Shared Score (out of 85)	Member Contribution — Peer Score (out of 15)	Total (out of 100)
Member 1			
Member 2			
Member 3			
Member 4			
Member 5			
Member 6			

How to Submit (Git)

Milestone 1 is submitted as a branch + pull request into main, in your team's cpe314-<edp>-capstone-team-NN repo — not your individual coursework repo. See 00_GitHub_Workflow/Student_Guide_Group_Project.md for the full reference.

Step 1 — Branch

Whoever starts this checkpoint's work branches off an up-to-date main once:

```
git checkout main

git pull

git checkout -b project/milestone-1
```

Everyone else works on their own smaller feature branches day-to-day, merging into project/milestone-1 as work lands — you don't all need to work directly on project/milestone-1 itself.

Step 2 — Commit Under Your Own Account

Everyone commits from their own GitHub account, on their own machine — never one teammate typing while committing as someone else. This is what the per-member contribution scoring and the Final Defense's Individual Q&A are built on. Quick sanity check anyone can run:

```
git config user.name

git config user.email
```

Step 3 — Push and Open the Pull Request

```
git push -u origin project/milestone-1
```

On GitHub: Compare & pull request → base main → title exactly "Milestone 1 — Team NN". Open it before the deadline — that open-timestamp is your submission time; further pushes to the same PR afterward are fine.

Step 4 — Do Not Merge Your Own PR

Leave the PR open once it's submitted. Claude reviews it against this checklist's categories and posts a per-member contribution table; your instructor still does the live in-class demo/grading against this checklist before it gets merged into main.

PR Checklist

- ☐ project/milestone-1 is up to date with everything the group has merged so far
- ☐ PR title is exactly "Milestone 1 — Team NN"
- ☐ Every member's contribution is reflected in their own commits, under their own account
- ☐ PR opened before the deadline (further pushes after are fine)
- ☐ You did not merge it yourselves
